Waterproof – can be used as a temporary roof covering

Non–tenting

Airtight at normal building pressures

Excellent water vapour permeability

Strong – excellent nail tear and tensile strengths

Quiet under wind loading

Durable – heat and UV stable

Lightweight

Easy to handle and install

Ideal for new build
Typical Constructions

Pitched Roofs

Horizontal Installation on a Continuous Substrate

Vertical Installation on a Discontinuous Substrate

**Figure 3c** – Insulation Between Rafters – Sarking Board – Battens & Tiles

\* The requirement for a vapour control layer and / or under the tile ventilation should be assessed to BS 5250:2002. Vapour check plasterboard or a separate vapour control layer can be used as preferred.

\*\* Kingspan Kooltherm® K18 Insulated Board contains an integral vapour control layer which, with appropriate detailing at joints, penetrations and wall perimeters, can increase the vapour resistance of the roof lining.
Design Considerations

Sustainability & Responsibility

Kingspan Insulation has a long-term commitment to sustainability and responsibility: as a manufacturer and supplier of insulation products; as an employer; as a substantial landholder; and as a key member of its neighbouring communities.

A report covering the sustainability and responsibility of Kingspan Insulation Ltd’s British operations is available at www.kingspaninsulation.co.uk/sustainabilityandresponsibility.

Specification Clause

*Kingspan nilvent®* should be described in specifications as:

The breathable membrane shall be *Kingspan nilvent®* comprising a laminated 3-layer polyolefin construction and shall be applied in accordance with the instructions issued by Kingspan Insulation Limited.

Details also available in NBS Plus. NBS users should refer to clauses:

- H21 130, H30 350, H31 280, P10 320 (Standard and Intermediate)
- H21 20, H30 50, H31 55, P10 65 (Minor Works)

Pitched Roofs

Horizontal Installation on a Continuous Substrate

In these cases, the breathable sarking membrane is installed either under counter-battens, which provide a channel for water drainage (Figures 1a–1c), or, in situations with a sarking board under a natural slate roof, directly under the slates (as neither tile battens nor counter-battens are used) (Figures 1d and 1e).

The membrane is laid taut, and joints between runs of membrane are sealed with tape, if required.

Vertical Installation on a Discontinuous Substrate

*Kingspan nilvent®* is installed in vertical runs, from eaves to eaves, in one length, under counter-battens (see Figure 2a). Installed in this way there will be no laps along the length of a run and laps between runs can be formed over a rafter, where counter-battens can secure them and make an airtight joint. The membrane should be laid taut, with no valleys between rafters.

NB It is theoretically possible to install the membrane vertically with a valley between rafters, however this adds no technical benefit, will prove cumbersome, and has the disadvantage of allowing greater wind induced membrane movement (see section on ‘Wind Induced Membrane Movement’).

Horizontal Installation on a Discontinuous Substrate

In situations where there is no continuous surface (see Figures 3a–3c), the breathable sarking membrane can be draped over the rafters or counter-battens, to provide a channel for water drainage. There should be a minimum 10 mm gap, between the membrane and the tile / slate batten, to afford a drainage channel for any penetrating rain. No counter-batten is required above the *Kingspan nilvent®* as water can freely drain under the tile / slate battens.

NB It is possible to have the membrane laid taut with counter-battens above. This is not as practical and incurs the cost penalty of extra counter-battens. It does, however, have the advantage of allowing reduced wind induced membrane movement (see section on ‘Wind Induced Membrane Movement’).

In these situations, it may not be practical to seal the laps between the runs of *Kingspan nilvent®,* and the roof should be considered as being unsealed.

General

**Waterproofing**

If installed as per the instructions given in this document, *Kingspan nilvent®* will give a watertight structure under normal weather conditions. *Kingspan nilvent®* can be safely used, even in constructions with a large number of nail penetrations through the membrane, e.g. where natural slates are nailed directly into a sarking board.

**Ventilation and Condensation Risk**

Most buildings contain air that is more humid than the air outside of that building. This humidity differential drives the moisture from the inside to the outside of a building's structure. When the moisture is confronted with a relatively cold and impermeable layer it may condense. In pitched roofs, sarking felt can be such a layer.

The traditional way of avoiding the risk of condensation in roofs, is to ventilate the moisture away, by introducing airflow directly above the insulation layer and below the sarking felt. Modern remedies for roofs include the use of breathable sarking membranes to replace sarking felt.

Breathable sarking membranes negate the need for ventilation directly above the insulation layer. They do this because they have a low vapour resistance, which allows water vapour to escape through the breathable membrane to the outside of the building. Studies have shown that ventilation directly above an insulation layer can reduce its thermal efficiency.

BS 5250: 2002 (Code of practice for control of condensation in buildings) defines a breathable membrane as a membrane with a vapour resistance that must not exceed 0.60 MN·s/g. It further sub-defines breathable membranes into two types: HR breathable membranes have a vapour resistance > 0.25 MN·s/g; and LR breathable membranes have a vapour resistance that must not exceed 0.25 MN·s/g. *Kingspan nilvent®* is an LR underlay, as defined by BS 5250: 2002, and has a vapour resistance of 0.17 MN·s/g.

There must be adequate provision, for vapour to disperse to atmosphere, outside of *Kingspan nilvent®*.

For horizontal installation on a continuous substrate and for vertical installation, Kingspan insulation recommends the use of minimum 25 mm thick counter-battens over the breathable sarking membrane, to create an airspace, between the breathable membrane and the tile / slate battens, large enough to encourage air movement. They also allow the dust and debris from tiling and slating to slide down the slope and emerge at the eaves. The use of counter–battens also makes it easier to achieve interconnecting airspaces at interruptions to the main roof area – such as roof windows, chimneys, dormers, hips, and valleys.

For horizontal installation on a discontinuous substrate, counter–battens are not necessary to provide air movement. As long as *Kingspan nilvent®* is draped such that there is a minimum 10 mm gap between the membrane and the tile / slate batten, the void so created will be sufficient.

With some roof coverings (e.g. pantiles, natural slates and cambered plain tiles), irregularities in their surfaces should allow sufficient natural ventilation to remove moisture from the space above the breathable membrane. With other roof coverings (e.g. sheet metal, interlocking tiles and artificial slates), provision of vents to encourage ventilation may be necessary.

Natural slates nailed through *Kingspan nilvent®* into a sarking board, without counter–battens or slate battens, provide for enough air movement to disperse vapour because of the gaps created by their irregularity. Artificial slates may not be suitable for direct fixing to a sarking board, because the regularity of their shape may not provide for enough air movement to disperse vapour. It may be necessary to put counter–battens and slate battens in place under artificial slates, to provide an airspace for ventilation.

Ventilation beneath the underlay is not required, and should be avoided.

**Airtightness & Sealed vs. Unsealed Constructions**

As we drive for buildings with lower and lower U–values, in order to save on wasteful heat losses, the component of heat lost from a building directly through its fabric becomes less, as a proportion of total heat lost. The proportion lost by accidental air–leakage becomes more significant. This air–leakage is not the same as deliberate ventilation. This accidental air–leakage into a roof can be lessened by sealing the roof construction to make it as airtight as possible.

Research has proven that a sealed roof approach yields a more energy efficient roof, as the impacts of incidental infiltrating cold air are negated. Therefore, if creating an unventilated roof, it is preferable to fully seal all joints in the breathable sarking membrane with tape. 75 mm wide acrylic double sided adhesive tape should be used for sealing joints in *Kingspan nilvent®*.

However, there is limited point in carefully sealing a roof structure if the specified breathable membrane is not airtight. *Kingspan nilvent®* is airtight at normal building pressures.
The ideal is to install Kingspan nilvent® in a manner that is practical, and maximizes the ability to achieve an airtight construction.

The use of horizontal runs of Kingspan nilvent® is by far the most practical method of installation, however, it is difficult to achieve airtightness unless the Kingspan nilvent® is to be laid onto a continuous surface (see Figures 1a–1e). The taping of breathable membrane joints is considerably easier to achieve if this is the case.

The use of vertical runs of Kingspan nilvent® is not as practical a method of installation as horizontal runs, however, it is easy to achieve airtightness as the laps between runs are sealed by the counter-battens that are installed over them (see Figure 2a).

If the sealing of the roof is deemed to be unimportant, horizontal installation without sealing joints with tape will always be the most practical solution, regardless of whether it is laid onto a continuous or discontinuous surface (see Figures 1a–1e and 3a–3c). However, it must be stressed that these roof configurations are not recommended, on thermal efficiency grounds.

Wind Induced Membrane Movement
Wind blowing over a pitched roof generates positive and negative air pressures. These air pressures can cause underlays to move up and down. This effect is increased if the underlay is draped rather than installed taut. A roof underlay is required to reduce the wind loading on the tiles / slates, in order to stop them from becoming detached from the roof.

Tile / Slate Damage
Under extreme conditions, if the membrane stretches as it moves up and down, it can knock against the tiles / slates and cause damage. The upward deflection of the underlay, under maximum negative pressure, must be small enough to avoid contact with the underside of the tiles / slates.

Kingspan nilvent® has mechanical properties sufficient to prevent this effect, given the wind uplift forces prevalent in the UK and Ireland.

Wind Noise
Under extreme conditions, underlays can produce a noise, irritating to occupants, as they move up and down. Kingspan nilvent® is quiet under wind loading.

Mansard Roofs / Walls
Kingspan nilvent® can be used for the construction of insulated tiled or slated mansard roofs / walls. Its installation procedures are identical to those for pitched roofs.

Timber Frame Walls
Installation
Kingspan nilvent® may be installed in horizontal or vertical runs. In both cases, upper layers must overlap lower layers, so water is shed away from the ply, OSB, or insulation sheathing.

The membrane is fixed taut, and joints between runs of membrane are sealed with tape, if required.

Waterproofing
Kingspan nilvent® resists windblown rain and snow, and will protect the sheathing and timber frame from external moisture penetration. The product can be used as a temporary weather protection during construction, prior to the completion of external brickwork or cladding. This time period must be limited to two months, as Kingspan nilvent® is not resistant to long term UV exposure.

Ventilation and Condensation Risk
Condensation can be controlled, in timber frame walls, by ensuring there is a layer of high vapour resistance on the warm side of the insulation. The vapour resistance of the wall lining can be increased by the use of: a vapour check plasterboard*, the use of Kingspan Kooltherm® K18 Insulated Plasterboard, which contains an integral vapour control layer*, a layer of polythene sheeting*, or by the application of two coats of Gyproc Drywall Sealer, if required.

* With appropriate detailing at joints, penetrations and wall perimeters.

A breathable membrane with low vapour resistance, e.g. Kingspan nilvent®, allows any moisture that does penetrate the construction to escape to the outside of the building.

A condensation risk analysis should be carried out following the procedures set out in BS 5250:2002 (Code of practice for the control of condensation in buildings). The Kingspan Insulation Technical Service Department (see rear cover) can provide this service.

Fire Stops
Current Building Regulations / Standards should be considered with regard to the requirements for, and provision of, fire stops.

Lightning Protection
Building designers should give consideration to the requirements of BS / I.S. EN 62305: 2006 (Protection against lightning).

### Sitework

#### Pitched Roofs

**Horizontal Installation on a Continuous Substrate**

- **Start installation at the eaves.**
- **Fit an eaves strip, of a UV-resistant material, to overhang the eaves / fascia by 50–60 mm.**
- **Lap the Kingspan nilvent®, logo–up, over the eaves strip (if required), with the bottom edge of the Kingspan nilvent® in line with the top of the fascia.**
- **Kingspan nilvent® should be laid taut.**
- **Temporarily fix in place with clout nails, and cut to length with a sharp knife.**
- **The second run of Kingspan nilvent® should lap over the top of the first, by the distance shown in the table below.**

<table>
<thead>
<tr>
<th>Rafter pitch (degrees)</th>
<th>Minimum lap (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.5 – 14</td>
<td>150</td>
</tr>
<tr>
<td>15 – 34</td>
<td>100</td>
</tr>
<tr>
<td>≥ 35</td>
<td>75</td>
</tr>
</tbody>
</table>

- **The printed tramlines on the top surface of Kingspan nilvent® indicate a distance of 150 mm.**
- **Use 75 mm wide acrylic double sided adhesive tape to seal horizontal laps between runs of Kingspan nilvent® (unless otherwise specified).**

- **Vertical laps between lengths of Kingspan nilvent® should be not less than 100 mm wide, and be positioned so as to coincide with a rafter position.**
- **These laps will be secured and sealed by the later fixing of the counter–battens.**
- **Avoid vertical laps over the same rafter position, in successive runs of Kingspan nilvent®.**

**NB In constructions with a sarking board under a slated roof with no counter-battens or slate battens, the vertical laps are taped with 75 mm wide acrylic double sided adhesive tape, and fixed in place with clout nails.**

- **Continue installation up the roof, in the same manner, to the ridge. Install counter–battens (min. 25 mm deep) and tile / slate battens, in the usual manner, as proves necessary to fully fix the Kingspan nilvent® in place, and to provide a support for moving up the roof.**
- **Lap over the ridge by not less than 150 mm each side (total overlap of 300 mm).**
- **Complete the installation of counter–battens and tile / slate battens over the whole area installed.**

**NB In constructions with a sarking board under a slated roof with no counter-battens or slate battens, Kingspan nilvent® is laid over the whole roof using roof ladders or similar for access prior to slating.**

**Figure 5a Eaves – Fully Supported Horizontal Installation**

---
Figure 5b  Eaves – Fully Supported Horizontal Installation with Natural Slates

Figure 5c  Ridge – Fully Supported Horizontal Installation

Figure 5d  Ridge – Fully Supported Horizontal Installation with Natural Slates
Vertical Installation on a Discontinuous Substrate

- For ease of installation, thread a wood or metal bar through the core of the Kingspan nilvent® roll, and set it on bearers on the scaffold platform.
- The leading edge of the Kingspan nilvent® can then be taken up and over the ridge, and down to the opposite eaves.
- Fit an eaves strip, of a UV-resistant material, to overhang the eaves / fascia by 50-60 mm.
- Lap the Kingspan nilvent®, logo-up, over the eaves strip (if required), with the bottom edge of the Kingspan nilvent® in line with the top of the fascia. Kingspan nilvent® should be laid such that it is taut in both horizontal and vertical directions.
- Each run of Kingspan nilvent® should be installed in a single piece from eaves to eaves.
- Temporarily fix in place with clout nails, cut to length with a sharp knife, move sideways and repeat the process.
- The second run of Kingspan nilvent® should lap over the first by not less than 100 mm, and be positioned so that the lap coincides with a rafter position.
- The printed tramlines on the top surface of Kingspan nilvent® indicate a distance of 150 mm.
- These laps should be secured and sealed by the fixing of counter-battens (min. 25 mm deep), as work progresses across the roof. Counter-battens should be fixed through to the rafters below, with fixings at a maximum of 300 mm centres.
- Continue installation across the roof in the same manner, then install tile / slate battens over the whole area installed.

NB Kingspan nilvent® can be laid in a vertical orientation with a drape. However, counter-battens will still be required to give an effective seal. If sealing of the roof is not required, and counter-battens are not specified, it will prove a lot easier to install Kingspan nilvent® horizontally with a drape (see page 10).

Figure 6a Eaves – Vertical Installation

Figure 6b Ridge – Vertical Installation
**Sitework**

**Horizontal Installation on a Discontinuous Substrate**
- Start installation at the eaves.
- Fit an eaves strip, of a UV-resistant material, to overhang the eaves / fascia by 50–60 mm.
- Lap the **Kingspan nilvent®**, logo-up, over the eaves strip (if required), with the bottom edge of the **Kingspan nilvent®** in line with the top of the fascia.
- **Kingspan nilvent®** and the eaves strip should be laid in such a manner as to create a valley between rafters (see Figure 3a) or counter-battens (see Figures 3b–3c), to allow water drainage.
- Temporarily fix in place with clout nails, and cut to length with a sharp knife.
- The second run of **Kingspan nilvent®** should lap over the top of the first, by the distance shown in the table below.

<table>
<thead>
<tr>
<th>Rafter pitch (degrees)</th>
<th>Minimum lap (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.5 – 14</td>
<td>225</td>
</tr>
<tr>
<td>15 – 34</td>
<td>150</td>
</tr>
<tr>
<td>≥ 35</td>
<td>100</td>
</tr>
</tbody>
</table>
- The printed tramlines on the top surface of **Kingspan nilvent®** indicate a distance of 150 mm.
- It may not be practical to attempt to seal the laps between the runs of **Kingspan nilvent®**.
- Vertical laps between lengths of **Kingspan nilvent®** should be not less than 100 mm wide, and be positioned so as to coincide with a rafter.
- These laps will be secured and sealed by the later fixing of the tile / slate battens.
- Avoid vertical laps over the same rafter or counter-batten position, in successive runs of **Kingspan nilvent®**.
- Continue installation up the roof, in the same manner, to the ridge.
- Install tile / slate battens, in the usual manner, as proves necessary to fully fix the **Kingspan nilvent®** in place, and to provide a support for moving up the roof.
- Lap over the ridge by not less than 150 mm each side (total over lap of 300 mm).
- Complete the installation of tile / slate battens over the whole area installed.

*NB Kingspan nilvent® can be laid but without draping on a discontinuous substrate. In which case, install as in the method (shown on page 7) for horizontal installation on a continuous substrate. Effective taping of joints will prove extremely difficult.*
Abutments

- At any abutment, chimney stack or similar roof penetration, apply 1.5 mm butyl rubber tape (e.g. glazing tape) to the abutment.
- Turn up the Kingspan nilvent® at least 50 mm under the flashing, and secure it with a counter-batten / tiling batten, pressed firmly against the abutment, and fixed to the end rafter or trimmer.
- In constructions with a sarking board under a slated roof with no counter-battens or slate battens, the above method is followed without the batten to secure the membrane.

Figure 8a Abutments – Fully Supported Horizontal Installation

Figure 8b Abutments – Fully Supported Horizontal Installation with Natural Slates

Figure 8c Abutments – Vertical Installation

Figure 8d Abutments – Draped Horizontal Installation
Verges

- Extend the Kingspan nilvent® across the gable wall and overhang.
- Turn it up at least 50 mm behind the fascia board, before fixing with a batten to the flying rafter.
- Where no counter–battens are used, extend the Kingspan nilvent® across the gable wall and overhang, and extend it to fully cover the undercloak.

Figure 9a Verges – Fully Supported Horizontal Installation

Figure 9b Verges – Fully Supported Horizontal Installation with Natural Slates

Figure 9c Verges – Vertical Installation

Figure 9d Verges – Draped Horizontal Installation
Hips

- Fit the Kingspan nilvent® to the hipped end of the roof before covering the main roof area.
- Pull the Kingspan nilvent® over the hip rafter and trim off the surplus, leaving an overlap of at least 150 mm. Secure in the same manner as for the main roof area.
- Once the hipped end is covered, move round and lay Kingspan nilvent® on the main roof area.
- Fold over hip rafters, and trim off surplus material.

**Figure 10a** Hips – Fully Supported Horizontal Installation

**Figure 10b** Hips – Fully Supported Horizontal Installation with Natural Slates

**Figure 10c** Hips – Vertical Installation

**Figure 10d** Hips – Draped Horizontal Installation
Valleys
- Lay the Kingspan nilvent® along the main roof area until you reach the valley.
- Fold the Kingspan nilvent® into the valley. Trim off surplus leaving not less than 300 mm of material beyond the centre line of the valley.
- Laid in this way there is no need to apply a separate strip of Kingspan nilvent® in the valley.
- Cut counter-battens (if required) short of the valley, to encourage air movement and allow run-off of any water penetrating the tiles/ slates.
- Kingspan nilvent® forms an excellent underlay beneath zinc, lead or GRP valley gutter liners.

Figure 11a Valleys – Fully Supported Horizontal Installation

Figure 11b Valleys – Fully Supported Horizontal Installation with Natural Slates

Figure 11c Valleys – Vertical Installation

Figure 11d Valleys – Draped Horizontal Installation
Rooflights

- Please refer to the instructions provided by the rooflight manufacturer. In the absence of manufacturer’s information, cut and fit Kingspan nilvent® neatly around the rooflight kerb, with an upstand of 50 mm.
- Seal the underlay to the kerb all round, using 1.5 mm butyl rubber tape (e.g. glazing tape).

Slating and Tiling

- Slating and tiling over Kingspan nilvent® is exactly the same as on any other pitched roof except that, in some instances, the slate / tile battens (if required) are fixed to the previously applied counter-battens.
- It is, however, essential that slate or tiling rubble does not lie in contact with Kingspan nilvent® as this may facilitate water penetration.

Timber Frame Walls

Fixing

- Kingspan nilvent® can be fixed to a timber frame wall either horizontally or vertically.
- In both cases, it must be fixed so that upper layers overlap the lower layers by a minimum of 100 mm, so that water is shed away from the sheathing.
- Kingspan nilvent® must be secured at regular intervals using either nails or staples to prevent damage by wind.
- Nails should comprise galvanized mild steel, austenitic stainless steel, phosphor bronze, or silicon bronze. Staples should comprise austenitic stainless steel.
- The positions of studs should be marked on the face of the Kingspan nilvent®, usually with tape, to enable fixing of wall ties or battens.
- It is essential that the lowest timbers in the wall are protected by the breather membrane.

Lapping and Jointing

- Horizontal laps should be a minimum of 75 mm.
- For horizontal installation, vertical laps should be a minimum of 150 mm, with laps in adjacent strips of product staggered.
- For vertical installation, the vertical laps should be 150 mm minimum, if the laps are sealed with an acrylic double-sided adhesive tape or vertical battens applied to the outside of the membrane, or 400 mm min., if the laps are unsealed.

General

Pipe Penetrations

- For all pipe penetrations, Kingspan nilvent® is star cut and dressed up the side of the penetrations. Use tape to seal the Kingspan nilvent® around the pipe.

Damage Repair

- Whilst Kingspan nilvent® is strong and durable in normal use, it may be damaged by careless handling.
- The risk of damage may be increased if Kingspan nilvent® is left uncovered on the roof for longer than is necessary.
- Any repairs are normally carried out with self-adhesive tape before installation of the outer leaf / roof covering.

Temporary Waterproof Covering

- It is often necessary for Kingspan nilvent® to act as a temporary, waterproof, wall or roof covering.
- Kingspan nilvent® is UV-resistant and can be safely exposed on site for a period not exceeding 2 months.

Cutting

- Cutting should be carried out using a sharp knife.

Availability

- Kingspan nilvent® is available through specialist insulation distributors and selected builders’ and roofing merchants throughout the UK and Ireland.

Packaging and Storage

- The polyethylene packaging of Kingspan Insulation products, which is recyclable, should not be considered adequate for outdoor protection.
- Ideally, rolls should be stored inside a building. If, however, outdoor storage cannot be avoided, the rolls should be stored on their sides, on a clean dry surface, and protected from sunlight.

Health and Safety

- Kingspan nilvent® is chemically inert and safe to use.
- A Safety Information Data Sheet for this product is available from the Kingspan Insulation website www.kingspaninsulation.co.uk/safety or www.kingspaninsulation.ie/safety.

Please note that the white upper surface on this product is designed to enhance its performance. This surface will reflect light, including ultraviolet light. Therefore, if this membrane is being installed during very bright or sunny weather, it is advisable to wear UV protective sunglasses or goggles, and if the skin is exposed for a significant period of time, to protect the bare skin with a UV block sun cream.

Warning – do not stand on or otherwise support your weight on this product unless it is fully supported by a load-bearing surface.
Product Details

Composition
Kingspan nilvent® comprises a laminated, 3-layer polyolefin construction. The top layer provides protection from UV and mechanical damage. The middle layer is the functional layer. The bottom layer provides abrasion resistance. Kingspan nilvent® has a light grey upper surface, printed with the Kingspan nilvent® logo, and a dark grey lower surface.

Standards and Approvals
Kingspan nilvent® is manufactured to the highest standards under a management system certified to EN ISO 9001:2008 (Quality management systems. Requirements). Its use is covered by BBA Certificate 10/4757.

Standard Dimensions
Kingspan nilvent® is available in the following dimensions:

Water Vapour Resistance
Kingspan nilvent® is an LR underlay, as defined by BS 5250:2002 (Code of practice for control of condensation in buildings), and achieves a resistance of 0.17 MN/s/g when tested in accordance with BS 3177:1959 (1995) (Method for determining the permeability to water vapour of flexible sheet materials used for packaging).

Liquid Water Penetration Resistance
Kingspan nilvent® is classified as W1, when tested, unaged, in accordance with BS EN 1928:2000 – Method A (Flexible sheets for waterproofing. Bitumen, plastic and rubber sheets for waterproofing. Determination of watertightness), W1 is the best possible classification.

Kingspan nilvent® is non-venting, and can be fully or partially supported.

Air Permeability
Kingspan nilvent® is airtight, when tested at normal building pressures, i.e. 50 Pa pressure difference.

Tensile Strength
Kingspan nilvent® achieves an unaged tensile strength of 240 N / 50 mm in the longitudinal direction, and 180 N / 50 mm in the transverse direction, when tested in accordance with BS EN 12311–1: 2000 (Flexible sheets for waterproofing. Determination of tensile properties. Bitumen sheets for roof waterproofing).

Nail Tear Strength
Kingspan nilvent® achieves a nail tear strength of 120 N in the longitudinal direction, and 140 N in the transverse direction, when tested in accordance with BS EN 12310–1: 2000 (Flexible sheets for waterproofing. Determination of resistance to tearing (nail shanks). Bitumen sheets for roof waterproofing).

UV / Heat Ageing
Kingspan nilvent® maintains its W1 classification for liquid water penetration, and its tensile strength is only reduced to 220 N / 50 mm in the longitudinal direction, and 160 N / 50 mm in the transverse direction, when aged in accordance with BS EN 1297:2004 (Flexible sheets for waterproofing. Bitumen, plastic and rubber sheets for roofing. Method for artificial ageing by long term exposure to the combination of UV radiation, elevated temperature and water) and BS EN 1296:2001 (Flexible sheets for waterproofing. Bitumen, plastic and rubber sheets for roofing. Method of artificial aging by long term exposure to elevated temperature).

This means that Kingspan nilvent® maintains adequate functional performance after continuous exposure to UV-light at 50°C for 336 hours, and then continuous exposure to a temperature of 70°C for 90 days.

Kingspan nilvent® can be left exposed on a roof or wall for a period of up to 2 months, after which time it must be fully protected from UV-light.
Wind Noise Sensitivity

*Kingspan nilvent®* is quiet when exposed to the wind uplift forces prevalent in the UK and Ireland.

Resistance to Solvents, Fungi & Rodents

*Kingspan nilvent®* resists attack by mould and fungus growth, and will not encourage insect attack.

*Kingspan nilvent®* is resistant to most organic and inorganic chemicals, including acids, alkalis and salts. Direct contact with wet solvents causes temporary expansion and a slight loss of physical properties. *Kingspan nilvent®* is not affected by the timber preservatives and treatments traditionally used in the UK and Ireland to protect timber from rotting, even when they are not fully dried out.

Limiting Temperatures

*Kingspan nilvent®* retains its strength and flexibility at temperatures down to –40ºC and up to +80ºC.

Insulation Product Benefits

*Kingspan Kooltherm® K-range Products*

- With a thermal conductivity of 0.020–0.023 W/m-K these are the most thermally efficient insulation products commonly used.
- The thinnest commonly used insulation products for any specific U-value.
- Rigid thermoset insulation core is Class 0, as defined by the Building Regulations in England, Wales & Ireland, and Low Risk, as defined by the Building Standards in Scotland.
- Rigid thermoset insulation core achieves the best possible rating of < 5% smoke obscuration when tested to BS 5111: Part 1: 1974.
- Manufactured with a blowing agent that has zero Ozone Depletion Potential (ODP) and low Global Warming Potential (GWP).

*Kingspan Therma™ Range Products*

- With a thermal conductivity of 0.022–0.027 W/m-K these are amongst the more thermally efficient insulation products commonly used.
- Each product achieves the required fire performance for its intended application.
- Manufactured with a blowing agent that has zero Ozone Depletion Potential (ODP) and low Global Warming Potential (GWP).

*Kingspan Styrozone® Range Products*

- Rigid extruded polystyrene insulation (XPS) has the necessary compressive strength to make it the product of choice for specialist applications such as heavy duty flooring, car park decks and inverted roofing.
- Each product achieves the required fire performance for its intended application.
- Manufactured with a blowing agent that has zero Ozone Depletion Potential (ODP).

All Products

- Their closed cell structure resists both moisture and water vapour ingress – a problem which can be associated with open cell materials such as mineral fibre and which can result in reduced thermal performance.
- Unaffected by air infiltration – a problem that can be experienced with mineral fibre and which can reduce thermal performance.
- Safe and easy to install – non-fibrous.
- If installed correctly, can provide reliable long term thermal performance over the lifetime of the building.
Contact Details

Customer Service
For quotations, order placement and details of despatches please contact the Kingspan Insulation Customer Service Department on the numbers below:

UK
- Tel: +44 (0) 1544 388 601
- Fax: +44 (0) 1544 388 888
- email: customerservice@kingspaninsulation.co.uk

Ireland
- Tel: +353 (0) 42 979 5000
- Fax: +353 (0) 42 975 4299
- email: info@kingspaninsulation.ie

Technical Advice / Design
Kingspan Insulation supports all of its products with a comprehensive Technical Advisory Service for specifiers, stockists and contractors. This includes a computer-aided service designed to give fast, accurate technical advice. Simply phone the Kingspan Insulation Technical Service Department with your project specification. Calculations can be carried out to provide U-values, condensation / dew point risk, required insulation thicknesses etc... Thereafter any number of permutations can be provided to help you achieve your desired targets.

The Kingspan Insulation Technical Service Department can also give general application advice and advice on design detailing and fixing etc... Site surveys are also undertaken as appropriate.

The Kingspan Insulation British Technical Service Department operates under a management system certified to the BBA Scheme for Assessing the Competency of Persons to Undertake U-value and Condensation Risk Calculations. Please contact the Kingspan Insulation Technical Service Department on the numbers below:

UK
- Tel: +44 (0) 1544 387 382
- Fax: +44 (0) 1544 387 482
- email: technical@kingspaninsulation.co.uk

Ireland
- Tel: +353 (0) 42 975 4297
- Fax: +353 (0) 42 975 4296
- email: technical@kingspaninsulation.ie

Literature & Samples
Kingspan Insulation produces a comprehensive range of technical literature for specifiers, contractors, stockists and end users. The literature contains clear ‘user friendly’ advice on typical design; design considerations; thermal properties; sitework and product data.

Available as a complete Design Manual or as individual product brochures, Kingspan Insulation technical literature is an essential specification tool. For copies please contact the Kingspan Insulation Marketing Department, or visit the Kingspan Insulation website, using the details below:

UK
- Tel: +44 (0) 1544 387 384
- Fax: +44 (0) 1544 387 484
- email: literature@kingspaninsulation.co.uk
- www.kingspaninsulation.co.uk/literature

Ireland
- Tel: +353 (0) 42 979 5000
- Fax: +353 (0) 42 975 4299
- email: info@kingspaninsulation.ie

Kingspan Insulation Ltd reserves the right to amend product specifications without prior notice. Product thicknesses shown in this document should not be taken as being available ex-stock and reference should be made to the current Kingspan Insulation price-list or advice sought from Kingspan Insulation’s Customer Service Department. The information, technical details and fixing instructions etc. included in this literature are given in good faith and apply to uses described. Recommendations for use should be verified for suitability and compliance with actual requirements, specifications and any applicable laws and regulations.

For other applications or conditions of use, Kingspan Insulation offers a Technical Advisory Service (see above), the advice of which should be sought for uses of Kingspan Insulation products that are not specifically described herein. Please check that your copy of this literature is current by contacting the Kingspan Insulation Marketing Department (see left).

Kingspan Insulation Ltd is a member of:
The National Insulation Association (NIA)
